Back to Login Login Login Successful Login School Portal Hessen Forgotten password Back to the selection of the school O objectivo desta investigaÃ§Ã£o Ã© déterminer se o prÃ3prio tecido da medula Ã3ssea pode ajudar a regenerar (crescer) osso na Ã¡rea do maxilar onde serÃ¡ colocado um implante. O name do process chama-se Bone Repair Cell (BRC) Therapy. Uma tecido de medula Ã3ssea will be recolhida and sent to um laboratory onde will be processed to form corn cells. These new cells will be whole transplanted non-local regeneraÃ£o ou increase do solo sinus. The researchers are to test to see if these cells (BRC) ajudarÃ£o to form an indicaÃ§Ã£o Ã3ssea. A investigaÃ§o will also determine se o implant will be mais estÃ¡vel na Ã¡rea com novo crescimento Ã3sseo. State or doenÃ§a Phase of Intervention/treatment Tooth Loss Procedure: Seio augmentation and dental implant Biologic: Aastrom BRCs Phase 1 Phase 2 O objective geral to promote bone regeneration, using Staminais Cells Therapy Adults (AST) enfolded em colaboraÃ§Ã£o com a of Michigan, to allow dental implants in patients with a lack of adequate alveolar bone. This project specifically addresses the placement of dental implants in the sequence of increase of the regenerating nasal sinus tea. This new therapy mitigates the risks of other therapies by providing additional benefits for dog numbers © adequate cells for high quality regeneration, and has potential to become the new standard of care. In the patented manufacturing technology of Aastrom, aspiring marrow mills ilk-acos are expanded ex-vivo to enrich dog © Adult multipotent cells (Bone Repair Cells-BRC) capable of regenerating bone and blood vessels. The BRC will then be mixed with the extension of the matrix graft, beta-tricyclic phosphate (IUC) prior to its implantation at the regeneration site. Active Comparator Intervention/Treatment: lifting of the sinus plus dental implant Increased nasal sinus Transalveolar will be performed. After four months, dental implants will only be delivered if primary stability can be achieved. Intervention (Procedure/Surgery): Increased increase in sinus augmentation of Sinus lift and transalveolar dental implant. After four months, dental implants will only be delivered if primary stability can be achieved. Biologic/Vaccine: N/A; Only procedure for sinus augmentation and dental implant: Sinus lift breast augmentation and transalveolar implant dental implant. After four months, dental implants will only be delivered if primary stability can be achieved. Experimental: sinus elevation more BRC and increased sinus transalveolar sinuses. A unit dose of BRC (10 ml) will be mixed with a commercially available dose of LMR-64 (Cerasorb), which will be used as a carrier to deliver the dogs © Squid. Intervention (Procedure/Surgery): Increased increase in sinus augmentation of Sinus lift and transalveolar dental implant. After four months, the Dentals will only be delivered if the primary stability can be reached. Biologic/Vaccine: AAstrom BRC, sinus augmentation, BRC BRC Biological implant: augmentation of the breasts of Aastrom BRC, applicability of BRC, dental implant Primary Result measures: Mineral Density of Cell N o de (no manual manual) The mineral density of the core of the nucleus of nucleus [e160] The volume fraction of the cell histology analyzes the secondary measures of Secondary Outcome:Altercation of the linear radius heights of the bone (16; Team is is is
