The science of the properties of drugs This article requires further citations for verification. Please help improve this article by adding citations to reliable sources. Search sources: A "PharmaceuticalA" NewsA used safely and effectively by patients. It is also called the science of dosage shape design. There are many chemicals with pharmacological properties, but they need special measures to help them reach therapeutically relevant amounts at their sites of action. Pharmacy helps to link the formulation of drugs to their delivery and disposition in the body(1). Pharmaceuticals deal with the formulation of a pure pharmaceutical substance into a dosage form. Pharmaceutical branches include: Pharmaceutical formulation Pharmaceutical production Pharmacy arrangement Pharmaceutical technology Physical pharmacy Pharmaceutical law Pharmaceutical substances as well as usually white powders or tablets. The pharmaceutical industry is one of the largest industries in the world. The pharmaceutical company is the main provider of pharmaceutical products. The pharmaceutical company Nicholas Culpeper "Seventeenth century English physician who translated and used "pharmacological texts." References ^ "What is Pharmaceutical? [PharmaceuticalA] Sop.washington.edu. Retrieved 26.08.2013 ^ Rhodes, edited by Gilbert S. Banker, Christopher T. (2002), Modern Pharmaceutical, (15th ed.). Hoboken: Informa Healthcare. ISBN 0 824 744 691.CS1 maint: extra text: author list (link) External links Media related to Pharmaceutics on Wikimedia Commons Selection of Excipients for Injectable / Parenteral Formulations This pharmacy article is a stub. You can help Wikipedia by expanding it.vte Recovered from " Steroids (sometimes referred to as "roids" or "juice") are the same, or similar, to, some hormones in the body. The body produces steroids naturally to support such functions as combating stress and promoting growth and development. But some people use steroid pills, gels, creams, or injections because they think steroids can improve their athletic performance or their appearance. Anabolic steroids are artificially produced hormones that are the same, or similar, androgens, the male sex hormones in the body. There are more than 100 variants of anabolic steroids. The most potent androgen is testosterone (pronounced: tess-TOSS-uh-ron). Although testosterone is primarily a mature male hormone, girls' bodies produce small amounts of it naturally. Testosterone is sometimes taken as a supplement to increase muscle mass and strength. Some athletes take anabolic steroids to gain weight and bulk up. They may also use steroid supplements to contain dehydroepiandrosterone (DHEA) and/or androstenedione (also known as andro). For the most part, steroid supplements, which were found in health food stores or gyms, do not now legally require a prescription. DHEA and the few exceptions can still be purchased over the counter. Steroid supplements are weaker forms of androgens. Their effects are well known, but it is thought that if taken in large doses, they cause similar effects to other androgens such as testosterone, but research studies suggest that they do very little or nothing to improve athletic performance. here is what is known about steroid!The companies that make them often use false statements, and very little is known for long-term effects some of these substances have on the body. This is one of the reasons why the government has an action to protect citizens by overcoming the laws that control the distribution of steroids. How do anabolic steroids work? Anabolic steroids stimulate muscle tissue to grow and "loose" in response to training by imitating the testosterone effect naturally produced on the body. Anabolic steroids can stay in the body everywhere for a couple of days to about a year. Steroids have become popular because they can improve resistance, strength and muscle mass. However, research has not shown that steroids improve ability, agility or athletic performance. The dangers of steroid anabolic steroids cause many different types of problems. Some of the common side effects are: Acne Balding premature or hair loss The increase in mood oscillates hair blood pressure aggression problems greater possibilities to hurt muscles and jaws tendons (yellowing of the skin); Liver damage by increasing cholesterol levels; Increased risk of heart disease; Increased risk of infection; Increased risk of kidney failure; Increased risk of liver failure; Increased risk of lung failure; Increased risk of stomach failure; Increased risk of thyroid failure; Increased risk of pancreas failure; Increased risk of diabetes; Increased risk of hypertension; Increased risk of stroke; Increased risk of cancer; Increased risk of leukemia; Increased risk of lymphoma; Increased risk of multiple myeloma; Increased risk of osteoporosis; Increased risk of osteoarthritis; Increased risk of rheumatoid arthritis; Increased risk of gout; Increased risk of psoriasis; Increased risk of eczema; Increased risk of dermatitis; Increased risk of alopecia; Increased risk of hirsutism; Increased risk of gynecomastia; Increased risk of mastopathy; Increased risk of breast enlargement of the clitoris, the menstrual cycle changes the risks for the specific risks for boys for children Guys include: pain narrowing testicular when unrattening the impotence of breast development (incapacity to obtain an erection) the reduced sperm counting and infertility other problems steroids can also have serious psychological side effects. Some users can become aggressive or combative. I believe things are not true (disappointments) or have extreme feelings of mistrust or fear (paranoia). And the people who use steroids also seem to be at greater risk for the use of other drugs, such as alcohol or cocaine, often to counter some of the negative effects of steroids. Steroid users who inject drugs with a needle are at risk of HIV infection (human immunodeficiency viruses), the virus that causes AIDS, if they share needles with other users. People who use dirty needles are also at risk of contracting hepatitis, a liver disease, or bacterial endocarditis, an infection of the inner lining of the heart. Steroids: stacking and dependence some people "cycle" their steroid doses. This means that they take more steroid doses for a period of time, they stop for a period, then restart again. "Stacking" means taking two or more different anabolic steroids. Other steroid users can "pyramid" their steroids, starting from a low dose dose and gradually increasing the dose, frequency or number of anabolic steroids taken, then thintiers complete a cycle and start again. Stacking increases the risk of side effects for each individual drug, pyramiding allows the body to get used to high doses of steroids and periods without steroids help the body recover from drugs. There is no scientific evidence to support one or the other method. Both methods are dangerous to use. Unfortunately, steroids are sold over the counter in health food stores or gyms, so they are easily accessible to anyone. In the United States, it is illegal to sell steroids over the counter. To the steroid anabolic use is illegal and prohibited by professional sports organizations and medical associations. Although this, some athletes continue to take steroids because they think they give them a competitive advantage. As seen in high-profile cases, if an athlete is captured using steroids, the career of him can be destroyed. And there are serious health consequences. When you are at the right time, damaging your body or being disqualified are not intelligent ways to try to improve your athletic performance. Athletics. A star athlete means working hard and training you the healthy way: eat the right foods, practice and exercise for strength without the use of drugs. © © Shutterstock / Anabolic Steroids Dizain are Testosterone related drugs (male sex hormone) that are made in laboratories. Doctors use anabolic steroids for the treatment of hormone problems in men, delayed puberty and muscle loss from certain diseases. Bodybuilders and athletes could use abusing anabolic steroids in attempts to build muscle mass and improve athletic performance, often taking much higher doses than they would have been prescribed for a medical condition. By using them in this way, without a prescription from a doctor, it is not legal "or safe" - and can have long-term consequences. Anabolic steroids are just a kind of steroid. Other types of steroids include cortisol, estrogen and progesterone. These hormones are made in the adrenal glands, which sit atop the kidneys. The skin also produces some steroid hormones. Steroids come in many forms, such as oral pills, capsules, injections, patches, creams, ointments, gels, suppositories, or as a gel or cream. Short-term effects People who abuse anabolic steroids can experience many effects, some of which are serious: Healthy skin Increased blood loss in skin yellowing muscle building possible improvement of athletic performance improved long-term growth shaved (in teens) shaved height (if adolescents use steroids in front of their growth snap) high blood pressure changes in blood cholesterol (increase in ac ac ac ac ac Cholesterol or LDL, decreases in ac ac Godacfo Your clitoris enlargement period In addition, people who wind up steroids by injecting them the risk of getting HIV or hepatitis (a liver disease) if they share needles. More information on the link between infections and drug use. Some people who wind up steroids believe that they can avoid unwanted effects or increase the effects of drugs, using them in specific ways, sometimes called cycling, stackable or pyramidal. There is no scientific evidence that any of these approaches reduces the harmful effects of misery these drugs. drugs.
