How to turn off push to talk discord server

The first thing you should do is turn on developer mode for Discord. This will allow you to copy user, channel, and server IDs which are extremely helpful for moderation, reporting issues to Discord, and dealing with Discord bots. Read here for instructions on turning on developer mode and getting IDs.

The Administrator permission is a special permission on a Discord role in that it grants every Discord permission and allows users with that permission to bypass all channel-specific permissions. Because of this granting this role to any user or bot should be done with the utmost caution and on an as-needed basis. Because bots can automate actions on Discord, bots with this permission can instantly delete all of your text channels, remove your emotes and roles, create hundreds of roles with the Administrator permission and start assigning them to your other users, and otherwise cause unmitigated havoc on your server faster than you can even understand what is happening. While the chance of this happening with larger or more renowned public bots is low, you should be mindful that this is the sort of power you are giving to a Discord Bot if you grant it the Administrator permission and only do so if you are confident the bot and its development team can be trusted. Before giving this permission to a user, consider if giving them a role that has every other permission enabled will serve your purpose. This way you can at least protect your channels via channel permissions. You may also find on further consideration that the user in question does not even need every permission, and will be fine with only a couple of elevated permissions. If you do give Administrator to anyone, it is highly recommended to enable 2FA for your server as described in the next section.

Discord has several role-specific permissions that grant what would be considered "administrative functionality" to users (not to be confused with the actual Administrator permission). These permissions are considered sensitive enough that if you are in a server where two-factor authentication (2FA) is required for moderators, these permissions are disabled. You can read more about what 2FA is and how to enable it on your account here. The permissions for which this applies are as follows: Administrator Manage Server Manage Channels Manage Roles Manage Messages Kick Members Ban Members If you aren't using a bot for server moderation, your moderation is going to be done by using Discord's context menus. How to access each menu and how its options work will be discussed in detail below.

Server SettingsThe Server settings items allow you to configure the server as a whole, as opposed to managing individual members. Note that depending on the exact permissions you have as a moderator and whether or not your server has boosts or is verified/partnered, not all options shown may be available to you.

On Desktop: Right click on the server name and go to **Server Settings**

On Mobile: While viewing the server list, tap the server name and then **Settings** in the bottom right.

The important menu items for you to know are the following:

- Overview:** Requires the Manage Server permission to view. From here you can change the server name and region, set an AFK voice channel, set up system messages, change default message notification settings for members, and change the server invite background (unlocked at boost level 1).
- Roles:** Requires the Manage Roles permission. From here you can create, delete, edit, and reorder roles that are lower than your highest assigned role. Note that you cannot toggle permissions that you do not have on any of your roles.
- Emoji:** Requires the Manage Emojis permission. From here, you can upload new emojis, delete current emojis, or edit the name of current emojis.

Moderation: Requires the Manage Server permission. From here, you can set the verification level of the server and configure the explicit media content filter. If you are the server owner, you can also enable the 2FA requirement for server moderators.

Audit Log: Requires the View Audit Log permissions. This provides a log of moderation actions on the server. Once something is in the Audit Log, it cannot be deleted or edited, and as such, it is an excellent way to verify who has done what on the server and to troubleshoot any technical issues that may arise.

Integrations: Requires the Manage Webhooks permission. This allows you to manage all of the webhooks in your server, the channels that you are following, the bots in your server, and any platform specific integrations you can manage such as Twitch or Youtube. Additional information about this page and the types of integration can be found here.

Members: Allows you to view the members of the Discord server and their roles. You can filter the member list by an assigned role as well. If you have any permission that allows you to see the server options menu, you will be able to see this screen but will not be able to do anything but browse the members list. If you have the Manage Roles permission, you can also add or remove roles from a user. If you have the Kick Members permission, you can perform a server prune or remove individual members from the server. They can rejoin later with a valid invite link if you have the Ban Members permission, you can ban a member from the server. They will not be able to rejoin the server and their IP address will be blacklisted.

Invites: Requires the Manage Server permission. Allows you to view and delete active discord invite links along with their creator, number of uses and expiration time.

Member OptionsUser options allow you to manage individual server members. You can manage them from the Members server option as noted previously or through the following:

Desktop: Right click on a user's name anywhere in the server (online list, mention, message, or their voice channel presence)

Mobile: Tap a user's name anywhere in the server and then tap the "manage" option. If you only want to kick or ban a user you can do so without tapping the manage option. You can also copy their user ID by tapping the three dots in the upper right instead.

The most important menu options for you to know are as follows:

- Change Nickname:** Requires the Change Nickname permission. This allows you to set a server-specific name for the user in question and is useful for making sure people's names are appropriate.
- Kick [user]:** Requires the Kick Members permission. This removes the user from the server. They can rejoin with a valid invite link.
- Ban [user]:** Requires the Ban Members permission. This will allow you to select how much message history of a user to delete and enter a reason for your ban. It is generally recommended to leave the user's message history intact unless the user is spamming inappropriate messages or content for record keeping purposes. Additionally, it's recommended that you include a ban reason.
- Roles:** Requires the Manage Roles permission. You can quickly add or remove roles from a user.
- Voice Options**These are accessed in a similar fashion to member options, but are only visible while the user is in a voice channel.

The most important menu options are as follows:

- Server Mute** - Requires the Mute Members permission. This will prevent anyone in the server from being able to hear this user speak and lasts until someone else with the server mute permission unmutes them.
- Server Deafen** - Requires the Deafen Members permission. This will prevent the user from being able to hear anyone else speak. This state lasts until someone else with the server deafen permission undefeats them.
- Disconnect** - Requires the Move Members permission. This will forcibly remove the user from the voice channel. Keep in mind that they will be able to reconnect unless there is a channel permission on the voice channel that prevents them from doing so.
- Move To** - Requires the Move Members permission. You can move the member to a different voice channel from their current one even if they do not have permissions to connect to the target channel. They will be able to move to another voice channel unless there are permissions preventing them from doing so.
- Message Options**This menu allows you to manage a specific message on the server.

Desktop: Right click anywhere in a message, or mouse over the message and click the three dots to the right

Mobile: Press and hold on a message

The most important options on this menu are as follows:

- Pin Message:** Requires the Manage Messages permission. This will add a message to the list of pinned messages in the channel for easy access later. You can view the pinned messages by clicking the pin symbol near the top right of the screen (on desktop) or by pressing the same symbol after tapping the channel name (on mobile). From here, you can also un-pin a message.
- Delete Message:** Requires the Manage Messages permission. This will permanently remove the message from Discord. If the message contains content that breaks Discord's Community Guidelines or Terms of Service, you should also report the message. You can learn more on how to Delete and Report messages as well as how to report content to Discord properly here. Some permissions are integrated into other areas of Discord or are more implicit. The following permissions should only be granted to moderators or trusted users.
- Manage Channels** - Allows users to edit channels by mousing over the channel name and clicking the gear, or by tapping the channel name at the top of your mobile device and then tapping settings. You can change the channel name, implement slow mode, manage channel permissions, or delete the channel.
- Mention @everyone, @here, and All Roles** - Allows users to mention all users on the server, all online users with access to the channel in which the message is sent, or all users in a specific role even if that role's "allow anyone to mention this role" permission is disabled.
- Send TTS Messages:** Allows users to start a message with /tts to cause Discord to read their message out loud to everyone currently focused on the channel.
- Priority Speaker:** While users with this permission are talking in a voice channel, the volume of other users will be lowered. While some advanced Discord server configurations may require otherwise, the following permissions are generally good to give to everyone:
- Change Nickname:** Allows users to set their own nickname on the server, different from their username.
- Read Text Channels & See Voice Channels:** Allows users to see channels and read messages. Embed Links: Allows for a preview of links sent by users. If disabled, users can still post links but they will no longer preview.
- Attach Files:** Allows users to upload images and files to the Discord server.
- Read Message History:** Allows users to read messages sent in the channel while they were away. With this permission off, users are unable to read messages in the channel if they go to another channel or quit Discord.
- Use External Emoji:** Members with Discord Nitro will be allowed to use emoji from their other Discord server. Discord bots may specifically need this to implement some of their functionality.
- Add Reactions:** Allows users to add new reactions to a message. Members do not need this permission to click on an existing message reaction.
- Connect:** Allows users to join voice channels.
- Speak:** Allows users to speak in voice channels.
- Video:** Allows users to use Discord Video.
- Use Voice Activity:** User voice will be automatically detected when they are speaking. With this permission disabled, members must use push to talk to be heard in a voice channel.

"Chat Muting" UsersA common functionality of most Discord bots is the ability to mute a user not just in a voice channel but in a text channel as well. However, there is no Discord permission that allows you to "mute" a user in such a fashion. Instead, what happens is that a Discord bot creates a "mute role" and then for every channel in the server sets the channel permissions for that role such that users with that role are not allowed to send messages or add reactions. When you mute a user through the bot, it assigns them that role and thus prevents them from interacting in the server's channels. It is also possible to set this up yourself and then manually assign the mute role to users that need to be muted from chatting.

Moderation BotsA lot of moderation on Discord is done using bots. You can find plenty of them by doing some research online. Some options include MEE6, CarlBot, Zeppelin, Dyno, GiselleBot, Gaius, and more. You can learn about some of these bots and what auto-moderation looks like here.

Inviting BotsTo invite a bot to a server, you must have either Administrator or Manage Server permission

The goal of this article is to familiarize you with Discord permissions and moderation actions so that you can more effectively moderate or manage your own server. Now that you've finished reading this, hopefully you have a better idea of how to navigate Discord's menus and manage your members and messages. The most popular VoIP application released Discord Screen Share feature in the latest software edition. Of course, I have used it in direct messages, voice channels in a server, and more. I will be showing the readers how to use it and also the limitations of the feature. I wanted to know the maximum possibilities of the feature and how I can use it to improve my presence in the server. What is Screen Share in Discord? Discord's developing team was hearing the requests of passionate gamers such as myself. The developer's team added screen sharing functionalities that exceed my expectations, where I can do plenty of things with it. Of course, it comes with restrictions that made Discord Nitro (premium package) worthy of subscribing. Registered users can share desktop screen, gameplay, and other things that I will talk about it. How to Share Screen in Direct Message (Discord)? I always used direct messages to contact friends and shared my screen to solve game-related problems. Recently, I was able to solve problems related to Apex Legends (graphics settings) for higher FPS and smooth experience. Of course, I recommend the users to try this because it is a handy function that every Discord user must try. Call the person that you want to share the screen. Click on the "Turn on Screen Share" icon to continue. A small window will pop-up on the screen and select the stream quality, and then click on "Share" to start the process. The screen mirroring works smoothly on (email protected), and I must say that this function requires good upload speed. Normal screen mirroring doesn't require higher hardware specifications because you need a 1GHz processor, 1GB RAM, and 256MB video memory. How to Share Screen in Discord Server I'm always connected to the voice channels and constantly talking to the members. Sharing my screen comes handy when I want to explain other players regarding my situation in the game. I love to share the information on how you can mirror desktop screens or games in the voice channels. Join the voice channel of the server, and you can select any one of them. Click on the "Go Live" button to share the screen and start the process. A small window will appear on the screen "Screens" and then "Screen 1" to proceed. If you have a connected secondary display, then it will appear on the list and select "Screen 2 or 3" for mirroring it. The stream will begin and connected members and new members can view it. Remember, voice channel connected users will be able to watch the stream. The live service is not available to watch for everyone in the server, and they have to join manually to watch it. In short, no need to worry about privacy problems and you can keep it secure at the same time. Screen Share One Window Only Don't want to share the entire desktop screen? Allow me to guide you on how to share one window and keep the rest of the applications & desktop screens hidden from the world. I love the customizations because I can maintain privacy and get the job done without people knowing about what on the desktop. Again, Join the voice channel in the server and then click on the "Go Live" button. Select "Applications" and then select one window from the list. A new window pop-up on the screen and then click on "Go Live" to start it. How Do I Stream Games on Discord In this case, PC administrators need a decent gaming machine for the process. Launch the game and stay in the lobby and minimize the window. Check the game title appearing in the left bottom and click on the computer icon. A window will appear on the screen and then tap on "Go Live" to start the stream. A new window shows up on the screen and the stream begins. Registered users can minimize the video window and browse around normally. I maximized the video window for the sake of the demonstration, and you can monitor the number of people who are watching it. Screen Share on Discord Mobile (iPhone, iPad, and Android) The gaming communication application added a video calling feature in Discord, which lets you share your webcam and microphone on any voice channel. Fortunately, the feature supports Android and iOS mobile operating systems. In short, your iPad and iPhone supports webcam and microphone sharing capabilities. Join any voice channel of your choice. Tap on the video camera icon located at the bottom left side. Apple turns off camera function in third-party apps by default, so tap on "Device Settings" to grant permission. Tap on the Camera button to grant permission. Now, you are live and sharing microphone and camera capabilities with everyone. We have tested the function on Android phones and an iPhone, and it works flawlessly. The video quality is good on the 4G network, and I believe it will work smoothly on 3G mobile connections as well. However, you cannot share your phone screen on Discord, and that capability is not available. I'm accurate that the Discord team will add phone screen sharing somewhere near the future. I double-checked the settings for video options, but Discord did not have enough time to add advanced options for video call users. I have shared the snapshot above that shows you the number of options available in the settings, while sharing your camera and microphone in the video call. How to use Video Chat in Discord server Discord introduced Video Chat feature a few weeks back in the latest software update. Discord's official team worked on the Video Chat, so you can communicate with other players, teams, and management using the webcam. Join the Voice Channel. Make sure you have the role to share your screen and video chat. Find the "Video" option and click on it to turn on the camera. A new window will show up sharing your webcam visuals. You have plenty of options available in the webcam player, and you can even pop-up on the window to use Discord separately. You can mute your microphone, cut off the webcam stream, share your screen right from the player, and disconnect the call. However, you don't have the option to cut off the stream and remain in the voice channel. If you disconnect the webcam stream, then you will be exited from the voice channel, and forced to re-join to proceed to communicate in voice mode only. The video chat works beautifully and doesn't have problems until or unless you have hardware or compatibility issues. A good internet connection is required for the process to proceed smoothly. Final Words Screen Share is a wonderful feature in Discord that comes in handy for an avid gamer. I must say that it came in handy for me and my friends plenty of time when we wanted to configure the graphics settings and other problems.
