Amenorrhea primer adalah pdf

Amenorrhea primer dan sekunder adalah.

Erna Suparman, Eddy Suparman Abstract: Secondary Amenorrhea occurs when a reproductive age woman who has experienced menstruation, to a sudden menstruated stop for at least three consecutive months. The basic principle behind the physiology of menstrual function is composed of more organs' systems with their appropriate compartments where the menstrual cycle depends, as follows: compartment I, disorders of the uterus; compartment II, disturbances of the ovary; Compartment III, front pituitary disturbances; and IV compartment, central nervous system disorders (hypothalamus). Finding the cause of the Secondy Amenorrhea can be done by doing some tests or tests. The determination of the specific anatomical defect position is useful for obtaining appropriate treatment based on the cause of amenorrhea.keywords: secondary amenorrheaabstrak: dikatakan amenorrhoaabstrak: dikatakan amenarea sekunder bila seorang wanita usia reproduktif yang pernah mengalami haid, tiba-tiba haidnya flazenti scottish Seatikitnya 3 Bullan Berturut -tut. PrinSip Dasar Yang Mendasari Physiologists Dari Fungsi Menstruasi Memungkinkan Penyusunan Beerapa Sistem Kompartemen Yang Tepat Mana Siklus Menstruasi Bergantung, Yaitu: Kompartemen Ho Gangguan Pada Utero, Kompartemen II Gangguan Pada Ovario, Kompartemen III Gangguan Pada Front Hipofisis, Dan Kompartemen IV Gangguan Pada Sister Saraf Pusat (Hipotalamus). Kondisi Ini Bisa Dibagi Menjadi 2 Jenis, Yaitu Amenorrhea Primer Dan Sekunder. Amenorrhea Perlu Mendapat Penanganan Karena Bisa Menjadi Tanda Dari Penyakit Yang Serius. Salah Saintunya Tumor Pada Kelenjar Pitatari. Perlu Diketahui, Bahwa Normyna Sebelum Memasuki Masa Pubertas, Saat Hamil, Menyusi, Atau Ketika Memasuki Phase Menopause, Wanita Tidak Akan Mengalami Menstruasi. Of Luar Kondisi Dan Phase Tersebut, Jika Seorang Wanita Tidak Kunjung Mengalami Menstruasi Pertama Atau Tidak Mengalami Menstruasi Kemali, Dipartulukan Pemeriksaan Menyeluruh Introlustur Intorsuchiomastikan Penyebab Dan Faktor Pemimunya. Penyebab Amenorrhea Amenorrhea Bisa Disebabkan Oleh Beragam Kondisi, Mulai Dari Ganguan Pada Organ Reproduksi, Pada Tumor Kelenjar Platiuari, Hingga Ganguan Ormonal. Jika diuraikan Lebih lanjut, berikut Adalah beberapa kondisi atau penyakit Yang bisa menyebabkan amenorrhea: Gangguan pada organ reproduksi Beberapa gangguan pada organ reproduksi Yang bisa menyebabkan Tidak terjadinya menstruasi adalah: Tidak terbentuknya Rahim, rahim leher (serviks), atau vaginal Adanya Jaringan parut pada rahim akibat sindrom Asherman, komplikasi kuretase, atau komplikasi Operasi caesar Adanya obstruksi atau sumbatan of saluran reproduksi gangguan hormonal Penyakit dan kondisi Yang bisa menyebabkan terjadinya hormonal gangguan dan mencetuskan amenorrhea antara lain: gangguan thyroid healthy, termasuk hipertiroid atau hipotiroid tumor kelenjar ptiutari tumor ovary Kelebihan hormone prolaktin PCOS (Polycystic Ovaia Syndrome) Olahraga Dan Aktivitas Yang Berlebihan Stres Yang Berkelanjutan Dan Tidak Danganola Dengan Baik Piggunaan Obat Atau Prepared Hormon, Termasuk Suntik Kb Berat Badan Yang Terlalu Rendah, Termasuk Akibat Gangguan Makan, Serets Anorexia Atau Bulimia Insus Fissies NSI Ovarium Primer, Yaitu Induction Telur Yang Berhenti Bekerja Sebelum USA 40 Tahun Totale, so the whole whole The uterus among which the ovary is appointed in addition to the above causes, the risk of amenorrhea also increases in women who have a family history with the same conditions or are subjected to harsh sports training. Symptoms of menstrual or menstruation amenorraments are the process of decorating the uterine wall due to non-frozen egg. This condition generally occurs every 21st, ä, ~ "Once 35 days and is characterized by the release of blood from the vagina that lasts 2Ä e ä, ~" 7 days. Normally, menstruation will begin to occur in the age range of 11a ä, ~ "14 years and stop when you enter menopause. When Amenorrhea comes into, there is no menstruation or menstruation. Amenorrhea can be divided in 2 types, ie: primary amenorrhea, which is the condition that occurs in women 14th ages between ä, ~ "16 years who do not have non-expert menstruation even though he showed signs of secondary amenorrhea puberty, which It is the condition that occurs in women in fertile eth who have ever been previous and not pregnant menstruation, but not menstruation experience for 3 consecutive cycles or more non-menstruation experience, Amenorrhea can also be accompanied by several other symptoms depending on the underlying At the occurrence of Amenorrhea. If caused by hormonal disorder, additional complaints may appear, such as excessive hair growth, the change of sound becomes heavier, the emergence of acne, the issue of breast milk, even if not breastfeeding. Or hair loss. When going to the doctor to examine a doctor if you are not the menstruation for three consecutive cycles or less to experience the first menstruation, at the age of 15, especially if other disorders appear, as mentioned above. If you have been diagnosed with amenorrhea, check your doctor regularly. In addition to monitoring treatment results, this routine exam also aims to reduce the risk of complications. The diagnosis of amenorrhea to diagnose amenorrhea, the doctor will take care of complaints, there is no change in diet or sport, the use of some drugs before, and your clinical and family history. Furthermore, the doctor will make a complete examination, including the examination of the pelvic area and the reproductive organs. To ensure a diagnosis, the doctor will take a support exam in the form of: a pregnancy test, to ascertain whether amenorrhea is caused by pregnancy or not, especially for women in fertile eth who is sexually active in blood analysis that includes High hormone, thyroid, estrogen, FSH (follicle-stimulating hormone), DHEA-S (dehydroepiandrosterone sulfate), or testosterone, to ensure that there is no hormonal disorder that can cause amenorrhea scanning test with ultrasound, TAC or RM, Ä, is, to see if there are anomalies in the reproductive bodies and tumors in the pituitary gland (pofisi) the treatment of amenorrhea treatment for amenorrhea will be determined on the basis of the underlying cause. Some treatment options that can be given to doing with amenorrhea are: drugs I. Give and drugs hormonal therapy and hormonal therapy are data to trigger the menstrual cycle and hormonal disorders treat. Some types of drugs that can be administered to activate the menstrual cycle are KB, prepared pills or progestic drugs, analog gmr-a (gonadotropin analogue ruling hormone) or bromocriptine. Meanwhile, the hormone replacement therapy to overcome Amenorrhea will be regulated for the underlying cause. Some types of hormonal therapy that can be given are: Extrogenous hormone replacement therapy (ERT), for amenorrhea caused by primary ovarian insufficiency, this therapy will be compensated by progestin or progesterone to reduce the risk of reducing treatment of uterine androgen cancer of the hormone, for amenorrhea caused by polycystic ovary syndrome (PCOS) 2. 2. Lifestyle If Amenorrhea is triggered by a unhealthy lifestyle, the doctor recommends applying a healthy lifestyle by doing the following: 3. Operation even if rarely done, if Amenorrhea is caused by a tumor or a grated fabric A tumor removal operation can be made grated fabrics. Complications Complications Amenorrhea Amenorrhea depends on the underlying cause. If Amenorrhea occurs because of the absence of ovulation, infertility can occur (infertility). If caused by hormonal disorders, for example, the lack of estrogen levels, the risk of onset of osteoporosis can also increase. The prevention of Amenorrhea Amenorrhea is not always avoidable, especially if it is caused by interference with the reproductive organs, such as the formation of the uterus, of the cervix or vagina. If the child does not experience menstruation, at the age of 15, even if puberty appeared, examine the doctor, so the cause can be known as soon as possible. Furthermore, if Amenorrhea is linked to the lifestyle, you can reduce the risk by making the following modes: Keeping the ideal body weight to eat healthy and nutritious foods balanced stress manage in the right way for exercise, from resting regularly enough To consult a doctor before using whatever a medical doctor or amenorrhea supplement is a condition in which women have non-expert menstruation, even if it comes to adults or puberty have entered. While primary amenorrhea is a condition in which women do not have menstruation until it reaches 16 years. So what's caused? Dangerous? The average age of a woman living menstruation is 12-15 years. In reality, there are also those who have menstruation experience at age of 9 years before. Although the cause of this primary amenorrhea is the following, explained meeddoctor.com: the possibility of a tumor. The history of the family has amenorrhea. Excessive exercise. There are hormonal disorders. The occurrence of eating disorders such as extreme diets or bulimia. Well, if you are over 16 you still have non-expert menstruation too much, we recommend checking with a doctor so that you can't be some tests to find out if you have amenorrhea or not. Some types of tests that include blood tests that include pregnancy tests, alterations of thyroid functionality, ovarian functional tests and texteral hormonal tests. Moreover, usually subjected to different controls, such as TAC or the RMN. The hysteroscopic exam will also be carried out by inserting a small camera inserted through the vagina can also be done. Meanwhile, treatment for amenorrhea is usually the way to provide family planning pills and some drugs according to the doctor's advice. However, the possibility of a doctor will also suggest leading surgery if a tumor is found or there is an anomaly in the structure of the reproductive organs. (VEM / RIZ) (VEM / RIZ)
